(Copies of Specifications, Standards, Drawings, Bulletins and Publications required by suppliers in connection with specific procurement functions should be obtained from the procuring activity or as directed by the Contracting Officer).

3.1.9 Sense Outputs. With the input and timing waveforms as specified in paragraph 4.2.9, the sense outputs shall be as follows:

3.1.9.1 The output on sense lines, parity through sign shall be as shown in Figure 3, and defined as follows:

V_p NMT 175 mv

V_1 NLT 45 mv

3.1.9.2 Zero Noise (V_0 max) measured between $1.1\ ^{+0}_{-0.05}$ usec and $2.3\ ^{+0.05}_{-0}$ usec after the start of Logic Reset (FR) shall be NMT 25 mv.

3.1.9.3 An all zero output shall occur when Logic STAGAT is zero.

V_0 max = NMT 5 mv, 1.1 to 2.3 usec after RSET.

3.1.9.4 An all zero output shall occur when Module Select current is removed.

V_0 max = NMT 5 mv, 1.1 to 2.3 usec after RESET (FR).

3.1.10 Temperature Extremes.

3.1.10.1 The module shall operate as specified in paragraphs 3.1.8 and 3.1.9 at an ambient temperature of $-10^{\circ}C\ ^{+0C^{\circ}}_{-2.8C^{\circ}}$.

3.1.10.2 The module shall operate as specified in paragraphs 3.1.8 and 3.1.9 at an ambient temperature of $70^{\circ}C\ ^{+2.8C^{\circ}}_{-0C^{\circ}}$.

3.1.11 Vibration. The module shall exhibit no intermittent opens or shorts on Drive and Sense lines in excess of 1 microsecond while being subjected to the random vibration specified below:

Random vibration shall be Gaussian distributed with the exception that magnitude limiting shall occur at a peak to rms "g" ratio of 3 to 1.

Vibration in each of three mutually perpendicular axis shall be for not less than 2 minutes and not more than 6 minutes as follows: 3db/octave rollup 10 HZ to $0.12g^2$/HZ at 70 HZ, $0.12g^2$/HZ to 420 HZ, 3db/octave rolloff from 420 HZ to 2000 HZ.

Copies of specifications, standards, drawings, and publications required by contractors in connection with specific procurement functions should be obtained from the procuring activity or as directed by the contracting officer.

2.2 Conflicting Requirements. In the event of conflict between the requirements of the contract, this specification, and the documents listed in this section; the following order of precedence shall apply and the Contractor shall notify MIT APOLLO Management of the conflict as soon as it is determined.

(a) The contract.
(b) This specification.
(c) Documents listed in this section.

3. REQUIREMENTS

3.1 Performance

3.1.1 Dielectric Withstanding Voltage. The Shaft Assembly shall withstand a minimum of 150 Vrms applied across the case and each of the two leads for 60 sec. + 0 sec. - 6 sec. without affecting the operation of the unit.

3.1.2 Brightness. The electroluminescent panel portion of the Shaft Assembly shall emit a brightness of not less than 2.0 foot-lamberts with a maximum of 5.5 milliwatts power consumption, when 75 Vrms ± 1 Vrms at 400 cps is applied across the two leads.

3.2 Product Configuration

3.2.1 Drawings. The configuration of the Shaft Assembly shall be in accordance with APOLLO G & N Drawing 2003975 and all drawings and engineering data referenced thereon.

3.2.2 Workmanship. The fabrication of the Shaft Assembly, its assemblies, subassemblies, and parts, shall be such as to produce a unit free from any defect that would affect proper functioning in service.

3.2.3 Appearance. The finish, coatings, color, nameplate or product marking shall comply with the requirements specified herein or on the applicable drawings.

4. QUALITY ASSURANCE PROVISIONS

4.1 General. The contractor responsible for the manufacture of the Shaft Assembly shall be responsible for performing all test required herein.

4.1.1 Nonconforming Units. The failure of the Shaft Assembly to pass any examination or test of this section will automatically classify the unit as nonconforming. When nonconforming units are corrected by the contractor, the unit shall be reinspected. When corrective action has been taken, the reinspection of a nonconforming unit may be limited to the test or examination which defined the nonconformance or, when so directed by the cognizant inspector, a complete reexamination and retest of the unit may be required. Nonconforming units which have not been corrected will be considered for acceptance only upon formal application by the contractor to the cognizant procuring activity representative.

4.1.2 Test Conditions. Unless otherwise specified herein, the Shaft Assembly shall be subjected to tests under the following ambient conditions:

Temperature	25° ± 10°C
Relative Humidity	Not more than 90%
Barometric Pressure	28 to 32 inches Hg

NOTICE – WHEN GOVERNMENT DRAWINGS, SPECIFICATIONS, OR OTHER DATA ARE USED FOR ANY PURPOSE OTHER THAN IN CONNECTION WITH A DEFINITELY RELATED GOVERNMENT PROCUREMENT OPERATION, THE UNITED STATES GOVERNMENT THEREBY INCURS NO RESPONSIBILITY NOR ANY OBLIGATION WHATSOEVER; AND THE FACT THAT THE GOVERNMENT MAY HAVE FORMULATED, FURNISHED, OR IN ANY WAY SUPPLIED THE SAID DRAWINGS, SPECIFICATIONS OR OTHER DATA IS NOT TO BE REGARDED BY IMPLICATION OR OTHERWISE AS IN ANY MANNER LICENSING THE HOLDER OR ANY OTHER PERSON OR CORPORATION, OR CONVEYING ANY RIGHTS OR PERMISSION TO MANUFACTURE, USE, OR SELL ANY PATENTED INVENTION THAT MAY IN ANY WAY BE RELATED THERETO.

3.1.7.1 With the input voltage adjusted to 12.2 ± 0.1 VDC, and an ambient temperature of $-10^{\circ}\mathrm{C}\,^{+0\mathrm{C}^{\circ}}_{-2.8\mathrm{C}^{\circ}}$, the module shall operate as specified in sections 3.1.5 and 3.1.6, except threshold voltage shall be $35\,^{+7}_{-4}$ mv, and PNP and STROBE output amplitudes may decrease by 20%.

3.1.7.2 With the input voltage adjusted to 16.5 ± 0.1 VDC, and an ambient temperature of $70^{\circ}\mathrm{C}\,^{+2.8\mathrm{C}^{\circ}}_{-0\mathrm{C}^{\circ}}$, the module shall operate as specified in sections 3.1.5 and 3.1.6, except threshold voltage shall be $35\,^{+4}_{-7}$ mv, and PNP and STROBE output amplitudes may increase by 20%.

3.1.8 Vibration. The module shall perform as specified in paragraphs 3.1.5.1 through 3.1.6.3 when installed in an operating computer which is being subjected to the vibration requirements specified in the applicable specifications for the computer subsystem. Acceptance criteria for the module shall be the compliance of the computer subsystem with its applicable specifications.

3.2 PRODUCT CONFIGURATION

3.2.1 DRAWING. The configuration of the assembly shall be in accordance with APOLLO G&N Drawing 2003981 and all drawings and engineering data referenced thereon.

3.2.2 Maximum allowable weight of the assembly shall be 0.70 pounds.

4.2.3.3 Measure the resistance between pin 269 (chassis ground) and the chassis, and verify that it is as specified in paragraph 3.1.2.3.

4.2.4 Insulation Resistance Tests. Using a resistance bridge or equivalent with a test potential of 50 VDC limited to a short circuit current of 50 microamperes, perform the following:

4.2.4.1 Measure the resistance between any one pin B and all other pin B's, and any one pin E and all other pin E's, and verify that they are specified in paragraph 3.1.3.1.

4.2.4.2 Measure the resistance between each pin B and all pins G, H, I, J, and pins 126, 128, 103, 229, 234, and 268. Verify that they are as specified in paragraph 3.1.3.2.

4.2.4.3 Measure the resistance between each pin E and all pins G, H, I, J, and pins 126, 128, 103, 229, 234, and 268. Verify that they are as specified in paragraph 3.1.3.3.

4.2.4.4 Measure the resistance between pin 269 and all other pins on the module, and verify that they are as specified in paragraph 3.1.3.4.

4.2.5 Functional Tests

4.2.5.1 With the input signal of paragraph 4.1.5.1 applied to pins A & C of each stage, and the output (pin G) loaded with the circuit shown in paragraph 4.1.4, measure the output at pin G and verify that it is in accordance with paragraphs 3.1.5.1 and 3.1.5.2.

4.2.5.2 With the input signal of paragraph 4.1.5.1 applied to Pins D & F of each stage, measure the output at pin J and verify that it is in accordance with p paragraphs 3.1.5.1 and 3.1.5.2.

4.2.5.3 With the input signal of paragraph 4.1.5.2.1 applied to pins A & C of each stage, and the output (pin G) loaded with the circuit shown in paragraph 4.1.4, measure the output at pin G and verify that it is in accordance with paragraph 3.1.6.2.

4.2.5.4 With the input signal of paragraph 4.1.5.2.1 applied to pins D & F of each stage, measure the output at pin J and verify that it is in accordance with paragraph 3.1.6.2.

4.2.5.5 With the input signal of paragraph 4.1.5.2.2 applied to pin 268, measure the output at pin 126 and verify that it is in accordance with paragraph 3.1.6.1

4.2.5.6 With the input signal of paragraph 4.1.5.2.1 applied to pins A & C and D & F of each stage, and pin I loaded with a 1000 ohm ± 5% resistor, measure the output at pin I and verify that it is in accordance with paragraph 3.1.6.3.

4.2.6 Gain Resolution. Using the following formula, calculate the gain resolution for each stage, and verify that they are in accordance with paragraph 3.1.5.3.

NOTE: See paragraph 4.1.5.1 for definitions of symbols

$$\text{GAIN RESOLUTION} = AK - A_k$$

$$= AQ - A_q$$

4.2.7 Weight. Weigh the module to the nearest .01 pound. Verify that the weight does not exceed the maximum allowable weight specified in paragraph 3.2.2.

4.3 WORKMANSHIP. The following tests shall be performed under the conditions specified as a verification of good workmanship.

4.3.1 Marginal Voltage and Temperature Extremes.

4.3.1.1 With the input voltage and ambient temperature as specified in paragraph 3.1.7.1, repeat tests 4.2.5.1 through 4.2.6. Verify that the module performs as specified in paragraph 3.1.7.1.

NOTE: The module shall be maintained at the specified temperature for not less than 30 minutes prior to start of tests.

4.3.1.2 With the input voltage and ambient temperature as specified in paragraph 3.1.7.2, repeat tests 4.2.5.1 through 4.2.6. Verify that the module performs as specified in paragraph 3.1.7.2.

NOTE: The module shall be maintained at the specified temperature for not less than 30 minutes prior to start of tests.

4.3.2 Vibration. Install the module in an applicable computer. Subject the computer subsystem tothe vibration tests specified in the applicable JDC. Verify that the computer subsystem meets the requirements of the applicable specification.

4.2.7 **Workmanship.** The following tests shall be performed under the conditions specified as a verification of good workmanship.

4.2.7.1 **Vibration.** Install the module in an applicable computer. Subject the computer subsystem to the vibration tests specified in the applicable JDC. Verify that the computer subsystem meets the requirements of the applicable specification.

4.2.7.2 **Thermal Extremes and Marginal Voltages.** Repeat the tests of paragraph 4.2.6 at -10°C +0 -2.8°C and +70°C -0 +2.8°C to determine compliance with paragraphs 3.1.6 through 3.1.12. Modules shall be stabilized at thermal extremes for not less than ½ hour before testing.

4.2.7.3 **Weight.** Weigh the module to the nearest .01 pound. Verify that the weight does not exceed the maximum allowable weight specified in paragraph 3.2.2.

5.0 PREPARATION FOR DELIVERY

5.1 Preparation for delivery shall be in accordance with Specification ND 1002214.

6.0 NOTES. None.

3.1.6 **+5 VDC Source Circuit.** The output at pin 233 shall be in accordance with Table I.

Each nonconforming unit corrected by the contractor shall be reinspected. Reinspection may be limited to the test or examination which defined the nonconformance, or, when directed by the cognizant inspector, a complete retest and re-examination may be required. Nonconforming units which have not been corrected will be considered for acceptance only upon formal application by the contractor to the cognizant NASA representative.

4.1.2 Environmental Test Conditions. Unless otherwise specified, modules shall be tested under the following conditions:

a. Temperature: at +25° ± 10°C
b. Relative Humidity: 90% maximum
c. Barometric Pressure: between 28 and 32 inches of mercury

4.2.7 Workmanship. The following tests shall be performed under the conditions specified as a verification of good workmanship.

4.2.7.1 Vibration. Install the module in an applicable computer. Subject the computer subsystem to the vibration tests specified in the applicable JDC. Verify that the computer subsystem meets the requirements of the applicable specification.

4.2.7.2 Thermal Extremes and Marginal Voltages. Repeat the tests of paragraph 4.2.6 at -10°C +0 -2.8°C and +70°C -0 +2.8°C to determine compliance with paragraph 3.1.6. Modules shall be stabilized at thermal extremes for ½ hour before testing.

4.2.7.3 Weight. Weigh the module to the nearest .01 pound. Verify that the weight does not exceed the maximum allowable weight specified in paragraph 3.2.2.

2.2 Conflicting Requirements. In the event of conflict between the requirements of the contract, this Specification and the documents listed in this section, the following order of precedence shall apply and the contractor shall notify MIT Apollo Management of the conflict as soon as it is determined.

a. The contract

b. This Specification

c. Documents listed in this section

3. REQUIREMENTS

3.1 PERFORMANCE. The Display and Keyboard Assembly has the capability to store, display, and transfer binary information as required by the Apollo Guidance Computer. The assembly is comprised of a Keyboard Module, Power Supply Module and six Indicator Driver Modules.

3.1.1 Continuity. The resistance between pin 39 of J9 and chassis shall be 0.5 ohms maximum.

3.1.2 Insulation Resistance. The insulation resistance between pin 39 of J9, and all other pins connected together shall be 100 megohms minimum.

4.1.1 Test Conditions

4.1.1.1 Environmental. The assembly shall be tested under the following ambient conditions:

a. Temperature: 25° ± 10°C
b. Relative Humidity: 90% max
c. Barometric Pressure: 28 to 32 inches of Hg

4.1.1.2 Assembly Case Ground. The dynamic tests specified in paragraphs 4.2.6 and 4.2.16 shall be conducted with pins 8 and 39 of J9 connected to ground (0 VDC).

4.1.2 Nonconforming Units. Failure of the unit to pass any examination or test of this specification shall automatically classify the unit as nonconforming. Each nonconforming unit corrected by the contractor shall be reinspected. Reinspection may be limited to the test or examination which defined the nonconformance, or, when directed by the cognizant inspector, a complete retest and re-examination may be required. Nonconforming units which have not been corrected will be considered for acceptance only upon formal application by the contractor to the cognizant NASA representative.

4.2 TESTS

4.2.1 Drawing Compliance. The assembly shall be visually examined for compliance to the requirements of APOLLO G&N Drawing 2003994. Particular attention shall be given to inspection for damage to surfaces, structure, and equipment, including contaminants, pin misalignment, and legibility and appearance of marking.

4.2.2 Continuity. Verify that the resistance between pin 39 of J9 and the assembly housing is in accordance with paragraph 3.1.1.

4.2.3 Insulation Resistance. Remove all lights and modules except Keyboard from assembly. Using test equipment with a test potential of 50 VDC limited to a short circuit current of 50 microamperes, measure the resistance between pin 39 of J9 and all other pins of J9 connected together. Verify that the resistance complies with that specified in paragraph 3.1.2.

4.2.4 Input Requirements. All tests shall be performed with the input requirements specified in paragraph 3.1.3 applied, when required to the pins of J9 as detailed below:

4.2.4.1 14V Supply. The 14 VDC Supply shall be applied to pin 1 with pin 8 used as the DC return.

4.2.4.2 28V Supply. The 28 VDC Supply shall be applied to pins 21 and 30 with pin 8 used as the DC return.

4.2.4.3 5V Supply. The 5 VDC Supply shall be applied to pins 62 and 64 with pins 63 and 65 used as the DC return.

4.2.4.4 Input Sync Pulse. The Input Sync Pulse specified in paragraph 3.1.3.4 shall be applied to pin 7.

4.2.5 115V Supply. The 115 VRM Supply shall be applied to pin 38 with pin 40 used as the AC return.

4.2.6 Intensity Measurements. Display indicator intensity measurements shall be calculated in the following manner:

a. Electroluminescent Displays - intensity measurements shall be the average of six sample locations.

b. Incandescent Displays - intensity measurements shall be the average of six sample locations at least 1/8 inch in from the illuminated segment border.

c. Push Switches - intensity measurements shall be the average of a single centrally located reading for each of the push switches.

Display indicators shall be visually inspected for abnormal dark spots and light intensity variations.

4.2.7 Legend Illumination. Apply all inputs specified in paragraph 4.2.4. Vary the 10K ohm potentiometer from minimum to maximum resistance and verify that the brightness of the legends shall be as specified in paragraph 3.1.4.

4.2.16 Numerical Electroluminescent Indicators. Apply all inputs specified in section 4.2.4. Set the 10K ohm potentiometer for maximum resistance. Apply the appropriate RLYWD and RLYBT combinations specified in Table 3-4 and 3-5, and verify that the specified numerical electroluminescent indicators are illuminated in accordance with paragraph 3.1.13. See paragraph 4.2.6a.

4.2.16.1 Apply all inputs specified in paragraph 4.2.4. Set the 10K ohm potentiometer to minimum resistance. Program numerical electroluminescent indicators as specified in paragraph 3.1.13.1. Verify that the numerical electroluminescent indicators shall be OFF.

3.1.11.1 Logic Zero Input. With a logic "zero" applied to an input pin of J9 as specified in Table 3-2, contact closure shall exist between pins of J9 as specified in Table 3-2.

3.1.11.2 Logic One and Zero. The logic "ones" and "zeros" referenced in this section shall be as specified in sections 3.1.7.1 and 3.1.7.2

3.1.12 Isolated Relay Indicators. When programmed for RLYWD 12, and a logic "one" applied to an input pin of J9 as specified in Table 3-3, the corresponding isolated relay indicator shall be illuminated. The average intensity of the incandescent display shall be 15 +3 −4 ~~Foot-Lamberts~~. Also contact closure shall exist between pins of J9 as specified in Table 3-3.

3.1.12.1 Logic Zero Input. With a logic "zero" applied to an input pin of J9 specified in Table 3-3, a contact closure shall exist between pins of J9 as specified in Table 3-3.

3.1.11 Status and Caution Indicators. With a logic "one" applied to an input pin of J9 as specified in Table 3-2 and the input voltage set to 5.0 ± 0.1 VDC the corresponding status or caution indicator shall be illuminated. The current shall be monitored for each indicator. White shall be 225 ma ± 20%, yellow shall be 180 ma ± 20%. The intensity limit for the Status (white) indicators shall be 8-28 foot-lamberts and the maximum legend intensity shall not exceed the minimum by more than a ratio of 2:1 in a given panel. The intensity for the Caution (yellow) indicators shall be 8-28 foot-lamberts and the maximum legend intensity shall not exceed the minimum by more than a ratio of 2:1 in a given panel. The exception shall be the COMP ACTY Indicator, which shall be illuminated at an average intensity of 10-24 foot-lamberts with the 10K ohm potentiometer (ref. Para. 3.1.4) set to maximum resistance. Also a contact closure shall exist between pins of J9 as specified in Table 3-2.

3.1.13.3 Logic One and Zero. The logic "ones" and "zeros" referenced in this section shall be as specified in paragraphs 3.1.7.1 and 3.1.7.2.

3.2 PRODUCT CONFIGURATION

3.2.1 Drawings. The configuration of the assembly shall be in accordance with Apollo G&N Drawing 2003994 and all drawings and engineering data referenced thereon.

4. QUALITY ASSURANCE PROVISIONS

4.1 GENERAL. The contractor responsible for the manufacture of the assembly shall be responsible for the accomplishment of each test required herein. See Table 4-1, Product Performance and Configuration Requirement/Quality Verification Cross Reference Index.

4.2.4 Input Requirements. All tests shall be performed with the input requirements specified in paragraph 3.1.3 applied, when required to the pins of J9 as detailed below:

4.2.4.1 14V Supply. The 14 VDC Supply shall be applied to pin 1 with pin 8 used as the DC return.

4.2.4.2 28V Supply. The 28 VDC Supply shall be applied to pins 21 and 30 with pin 8 used as the DC return.

4.2.4.3 5V Supply. The 5 VDC Supply shall be applied to pins 62 and 64 with pins 63 and 65 used as the DC return. Current shall be measured as specified in Paragraphs 3.1.11 and 3.1.12.

4.2.4.4 Input Sync Pulse. The Input Sync Pulse specified in paragraph 3.1.3.4 shall be applied to pin 7.

4.2.5 115V Supply. The 115 VRM Supply shall be applied to pin 38 with pin 40 used as the AC return.

4.2.6 Intensity Measurements. Display indicator intensity measurements shall be calculated in the following manner, with no individual readings greater than 25% from the spec limit for the average of the electroluminescent displays and push switches.

a. Electroluminescent Displays - intensity measurements shall be the average of six sample segments, with the exception of COMP ACTY which is to be measured and recorded as an individual segment. See paragraphs 4.2.7, 4.2.14 and 4.2.16.

b. Incandescent Displays - intensity measurements shall be made on all legends at least 1/8 inch in from the illuminated legend border. See paragraphs 4.2.14 and 4.2.15.

c. Push Switches - intensity measurements shall be the average of a single centrally located reading for each of the push switches. See paragraph 4.2.8.

Display indicators shall be visually inspected for abnormal dark spots and light intensity variations.

4.2.7 Legend Illumination. Apply all inputs specified in paragraph 4.2.4. Vary the 10K ohm potentiometer from minimum to maximum resistance and verify the intensity of the segments as specified in paragraph 3.1.4. See paragraph 4.2.6a.
